

CONTENTS

1. Pseudo-random numbers	1
1.1. Random number and Monte Carlo simulation	1
1.1.1. Required properties of pseudo-random numbers	4
1.1.2. Required properties of functions $g(\cdot)$ and $g_m(\cdot\cdot\cdot)$	6
1.2. Equidistributed numbers in the Weyl sense	7
1.3. Multiply equidistributed numbers	16
1.4. Statistical tests with pseudo-random numbers	23
1.4.1. Statistical tests based on discrete random variable	24
1.4.2. Tests based on a continuous random variable	27
1.5. Exercises and supplementary results with pseudo-random numbers	30
2. Simulation of random variables	33
2.1. Simulation of discrete random variables	33
2.2. Simulation of continuous random variables in terms of one random number	40
2.3. Simulation of random variables by several random numbers	48
2.4. Simulation of normal random variable	55
2.5. Simulation of absolutely continuous multi-dimensional random variable	60
2.6. Exercises	65
3. Simulation of stationary sequences	71
3.1. Representation of stationary time sequences	71
3.2. Simulation of time sequences	79
3.2.1. Computations for discrete component (3.5)	79
3.2.2. Computations of causal component (3.7)	81
3.2.3. Computation of component (3.13)	82
3.3. Simulation of random field	86
3.4. Supplementary remarks on stationary sequences	94
3.4.1. Statistics of 1. order	95
3.4.2. Statistics of 2. order	101
3.4.3. Statistics for estimation of $S(\lambda)$	106
3.4.4. Statistics for random fields	107
4. Simulation of Markov chains	111
4.1. Finite Markov chain and its simulation	111
4.2. First exit from a permeable set	118
4.2.1. Countable state space	122
4.2.2. Quality control	124
4.2.3. On a classification of countable classes	127

4.3.	Markov chain in Euclidean space	128
4.3.1.	Permeable sets and exits	133
4.4.	Some models and problems with finite Markov chains	137
4.4.1.	Two walkers meeting model	137
4.4.2.	Repeated exits from a permeable set	141
4.4.3.	System of linear algebraic equations	144
4.4.4.	Optimization problems	148
4.5.	Markov chain and differential equations	150
4.5.1.	A class of numerical methods and associated chains	154
4.6.	Supplementary results and exercises	157
5.	Simulation of Markov jump processes	167
5.1.	Simulation of homogeneous jump process	168
5.2.	Simulation of non-homogeneous jump process	177
5.3.	Quality control of simulation	182
5.4.	Non-homogeneous process with special structure	191
5.5.	Compartmental models	204
5.6.	Exercises	211
6.	Simulation of Brownian motion	219
6.1.	Brownian motion	220
6.2.	Markov jump processes converging to Brownian motion	226
6.3.	First exit time	230
6.3.1.	IVPs associated with first exit time	236
6.4.	Exit through a part of boundary	239
6.5.	Brownian motion with drift	245
6.6.	Exercises with Brownian motion	250
7.	Simulation of generalized diffusion	255
7.1.	Generalized diffusion	256
7.2.	Approximation of generalized diffusion by MJPs	260
7.3.	Convergence of MJPs to generalized diffusion	269
7.4.	Exits from permeable sets	277
7.5.	Generalized diffusion with reflection	282
7.6.	Exercises with generalized diffusion	293
	Bibliographical notes	297
	Bibliography	301
	Index	307
